

Rescue / Evacuation System

TC013

Rescue Kit

- Contents:
- TC013
 - 1 Bag
 - 30 M rope
 - 2 Anchorage point lanyards
 - 2 CT15 hooks
 - Suspension harness
 - Weight: 7.2 kg

A rescue plan must always be developed whenever fall arrest systems are used and when personnel may not be able to self rescue should a fall occur. Hence such a plan should always be in place and should be initiated immediately.

Allsafe has designed the following rescue / evacuation plans to compliment this rescue system.

How to use the Rescue Kit: Rescue by one person

- 1 - One extremity of the rope is anchored above person to rescue level.
- 2 - The device remains anchored on the rescuer and descend until person to rescue level.
- 3 - Rescuer anchors himself with the person to rescue. (with a webbing anchorage point for example like LO032)
- 4 - Rescuer actions the winch to go up until he can remove the fall arrest device from the person to rescue.
- 5 - Rescuer puts the device in descent mode and they go down at a constant speed until reaching the closest level below.
